Pressure Drops VALUE KV

Directions for the Metric Pressure Drop Chart based on 160°F supply Temperature

STEP 1: Find the flow Rate in GPM

The flow rate is the output of the radiator at 160°F divided by 10,000 = GPM

STEP 2: Convert From GPM to L/H

Multiply GPM x 227 = Flow Rate in L/H

STEP 3: Find Pressure Drop In kPa

Look up the chart from L/Hr to find the pressure drop in KPA

STEP 4: Convert kPa to Feet of Head

Multiply kPa x 0.3346 = Pressure drop in Feet of Head 1bar=33.46 ft/head

Example: K2 24 x 24

Output at 160°F is 3546

Flow Rate in GPM = 3546/10000 = .3546GPM

GPM x 227 = litre/hour

.3546 x 227 = 80.49 L/H

80.49 = 0.08 kPa

.08 x .3346 = 0.026768 ft/h

12 Classic Column Radiators

The column radiator is available in three different heights with either three or four bars and comes in a variety of lengths. Please note the last set of numbers in the part# denotes the number of sections NOT the finished length in inches. Each Classic Column comes with wall brackets and hardware pack. Floor brackets are available. See product # V-CLFS on page 29. Columns require a 1/2" BSP connection, valves sold separately. Warranty on Column Radiators is 5 years.

Not suitable for Glycol systems.

Non Scratch Bushing Wrench

To be used with classic column units only

V-CCWRENCH

Item number 53 on page 29

See page 32 to calculate the heat output from existing cast iron column and tubular radiators.

32 Calculating Existing Cast Iron Radiator Output in BTU's/Hr

To find the output of a cast iron radiator, you need to know the surface area in square feet of the radiator. Follow these steps to calculate the square feet of radiation. NOTE: Column and Tube cast iron radiators are the two main types.

Step #1. Calculate the square footage of one section of the radiator.

- Measure height of section
- Measure width of section
- Find square feet of section in Chart # 1 for COLUMN or Chart # 2 for TUBE type radiator

Step #2. Multiply the square feet of the one section by the number of sections. Equals the cast iron radiator's total square foot of radiation.

Step #3. Multiply the total square foot of the radiator by the BTU output per square foot according to the heating supply temperature, Chart #3.

Please note that a house heated with all cast iron radiators, the supply temperature generally does not exceed 140°F or 90 BTU's per square foot output for the cast iron radiator.
